

Installations finally faster, easier, and more secure – with the **compacer Package Installer** from **edbic 3.6** onwards

- **Significant Time Savings:** Installation times are reduced to mere minutes. Compared to conventional methods, this represents a time saving of over 90%.
- **Optimized Resource Management:** The system ensures efficient and balanced power distribution across individual edbic components.
- **Automated Update Communication:** Information regarding new versions, updates, and bug fixes can be retrieved directly and easily via dedicated channels.
- **Full Transparency:** All modifications and new features are documented in detail and can be reviewed in the changelog at any time.
- **Scalable Cluster Solutions:** The configuration of high-availability scenarios (e.g., 3- or 5-node clusters) is designed to be simple and intuitive.
- **Accelerated Deployment:** New software packages are available significantly earlier through this method than via manual installation.
- **Support Cost-Efficiency:** No additional costs are incurred for manual installation packages or the associated setup support.
- **Reduced Operational Costs:** Due to lower administrative overhead, you benefit from reduced maintenance fees compared to manual installations.
- **Centralized Dependency Management:** The installer automatically detects and installs required libraries or additional components. This eliminates manual errors caused by missing software prerequisites.
- **Standardization:** Every installation is identical. This significantly simplifies debugging and support, as there is no longer a need to search for individual path or configuration discrepancies.
- **Secure Rollback Functions:** Should an update cause unexpected issues, the package manager typically allows for a clean rollback to the previous version – a process that is extremely error-prone and timeconsuming when performed manually.
- **Integrity Verification:** During installation, the package manager verifies that files are intact and authentic, increasing security against tampered or corrupt installation media.
- **Clean Uninstallation:** The package manager removes all associated files without leaving a trace. Manual installations often leave behind „file corpses“ or orphaned configurations that can lead to system conflicts over time.
